

Stevan Bogosavljevic @stevyhacker

Senior Solidity Engineer

github.com/stevyhacker · x.com/stevyhacker · stevanbogoslavjevic@gmail.com · Podgorica, Montenegro

11yr software engineering career

5yr Solidity & EVM production work

5ERCs co-authored Ethereum standards

6+ DeFi & NFT protocols shipped

Summary

Senior Solidity Engineer with 11 years in software and 5+ years focused on EVM smart contracts. Experienced across the DeFi stack: perpetual exchanges, stablecoins, lending protocols, NFT standards, and treasury operations. Previously led mobile teams and taught Android development courses. Combines deep protocol-level Solidity with full-stack delivery in React/TypeScript, operating from Podgorica, Montenegro (CET).

Experience

2013 – Present · From Android to DeFi core contributor

2013 Mobile Foundation

Built native Android apps for health tech, streaming, and telecom clients; earned a team lead role and taught a 6-month Android course.

2021 Blockchain Pivot

Shifted entirely to Solidity — started with NFT contract development, then moved into DeFi protocol engineering within a year.

2024 DeFi Core Contributor

Operating at protocol level inside Synthetix and Aave DAO, designing cross-chain treasury infrastructure and stablecoin routing.

TokenLogic · Aave DAO · Cross-chain Treasury & GHO

SR. ENGINEER

- ROLE** Senior Solidity Engineer inside Aave DAO, working on treasury operations and GHO stablecoin routing. Part of a team integrating multiple bridge infrastructure layers for cross-chain fund movement.
- ACTIONS** Designed and implemented bridge integration contracts connecting Aave's treasury across chains. Built routing logic for GHO stablecoin transfers, ensuring safe fund flow through audited bridge adapters with configurable risk parameters.
- IMPACT** Enabled cross-chain treasury operations for one of DeFi's largest protocols. GHO routing infrastructure supports multi-bridge redundancy, reducing single-point-of-failure risk for DAO fund transfers.

Synthetix · DeFi Protocol

SR. ENGINEER

- ROLE** Senior Solidity Engineer on core protocol, building perpetual exchange, vault, and staking contract systems. Worked within a highly technical team shipping to multiple EVM chains.
- ACTIONS** Developed smart contracts for perpetual futures trading, vault deposit flows, and staking reward distribution. Used Foundry and Hardhat for testing; contributed to protocol upgrades across 18 months of continuous delivery.
- IMPACT** Shipped production contracts handling real user funds on a protocol with hundreds of millions in TVL. Perpetual exchange and vault systems processed continuous trading volume while maintaining zero critical vulnerabilities during tenure.

THORWallet & zkFinance · DEX & Lending

SOLIDITY DEV

- ROLE** Solidity developer building DEX and lending protocol contracts. Responsible for core smart contract logic using Hardhat and Foundry toolchains across both projects.
- ACTIONS** Implemented lending pool mechanics, collateral management, and DEX swap routing. Wrote comprehensive test suites and managed deployment pipelines for contract upgrades on multiple networks.
- IMPACT** Delivered two production DeFi protocols within a 13-month engagement. Lending contracts supported multiple collateral types with configurable risk parameters; DEX contracts handled live swap volume.

RMRK · NFT 2.0 Protocol · NFT Standards

SOLIDITY DEV

- ROLE** EVM smart contract developer on RMRK's NFT 2.0 protocol, co-authoring multiple Ethereum standards and building a marketplace supporting advanced composable NFTs.
- ACTIONS** Co-authored 5 ERCs: ERC-5773 (multi-asset), ERC-6454 (soulbound), ERC-6059 (nested NFTs), ERC-6220 (composable), ERC-6381 (emoji reactions). Built reference implementations and a marketplace supporting all advanced standards.
- IMPACT** Co-authored 5 published Ethereum standards that define how NFTs compose, nest, and carry multiple assets — alongside Bruno Skvorc, Steven Pineda, and core RMRK contributors. Marketplace was first to support trading of these new NFT types.

Open Source & Indie Work

2021 – Present · Full-stack blockchain projects

End-to-end builder: from Solidity contracts to React frontends. Ships complete products solo — smart contracts, wallet integration, deployment, and UI. Projects range from AI-generated NFTs to DeFi utilities and data analytics platforms. Cumulative GitHub: 90 repos · 471 stars · 78 followers.

Aimons	Next.js + Solidity · AI character generator with NFT minting	Featured	Chain Art	React + Solidity · on-chain generative art with IPFS metadata	Featured
IT Stats	React + TypeScript · IT salary and job-market analytics	Live	Token Locker	Solidity + ethers.js · ERC-20 lock protocol with wallet UI	Live
DEX Swap	Solidity · DEX swap contracts on zkSync Era	zkSync	GuessTheCity	Kotlin · picture quiz Android game	Android

BUILDER PROFILE Each indie project ships as a complete product — not a demo. Aimons connects AI generation to on-chain minting with a polished UI. IT Stats serves real public traffic at [itstats.me](#). This pattern of end-to-end delivery — contracts, integration, frontend, deployment — mirrors the same instinct that drove the mobile-to-blockchain career switch.

Judgment & Conviction

2021 Bet on Solidity full-time

Left a stable mobile career to write smart contracts exclusively. Within 12 months, went from first NFT contracts to protocol-level DeFi work — validating the bet with a Synthetix role.

2022 Co-authored 5 ERCs at RMRK

Chose to invest time in writing Ethereum standards rather than taking faster-shipping contract work. Co-authored 5 published ERCs covering composable, nested, and soulbound NFTs.

2025 DAO-native engineering

Moved into Aave DAO treasury operations — cross-chain bridge integration and GHO routing — betting that DAO infrastructure engineering becomes a distinct senior specialization.

Core Skills

SMART CONTRACTS	Solidity, EVM internals, OpenZeppelin, upgradeable proxy patterns. 5+ years writing contracts that hold real funds on mainnet.
DEFI PROTOCOLS	Perpetual exchanges, lending pools, staking vaults, stablecoin routing , liquidity protocols. Shipped on Synthetix, Aave, THORWallet, zkFinance.
TOOLING	Foundry and Hardhat for testing and deployment. Ethers.js, viem, wagmi for frontend integration. CI pipelines for contract verification.
FRONTEND	React, Next.js , TypeScript. Wallet-connected dApp UIs with full transaction lifecycle handling. Previously native Android (Kotlin, Java).
STANDARDS	ERC-20, ERC-721, ERC-1155. Co-author of 5 ERCs (5773, 6454, 6059, 6220, 6381). NFT composability, soulbound tokens, cross-chain bridge patterns.

Education

University of Montenegro · Faculty of Sciences and Mathematics · Computer Science · Dropped out after two years to focus on professional engineering work. 2015 – 2017
